Demeditec Diagnostics GmbH is a privately owned company located in northern Germany. Since the foundation in 1987 Demeditec has rapidly grown to become a successful and reliable manufacturer and supplier of in vitro diagnostic test kits. We are, therefore, proud to present an extensive product panel of non-radioactive (ELISA) and radioactive (RIA) test systems.

Our top-selling products feature Human and Veterinary Diagnostics, Endocrinology – especially Salivary Diagnostics-, Infectious Diseases, Autoimmunity, Biogenic Amines and Tumor Markers.

Our customers are located worldwide and include private laboratories, hospitals, universities as well as other research institutions and pharmaceutical companies.

To ensure the quality of our products, services and support, Demeditec has been certified according to EN ISO 9001 and EN ISO 13485 since 2003 and according to the GMP standard since 2011. These certifications, along with qualified and creative personnel, enable the development of innovative test kits in our R&D department.

We welcome you to be a part of our network and hope to convince you of the quality of our products and support.

Dr. Arndt Stüber  
General Manager

## Introduction

Dear partner,

by specializing and expanding our product range, we are able to supply new kinds of customer groups and establish our enzyme-immunoassays in numerous laboratories, hospitals, universities as well as other research institutions and pharmaceutical companies.

With this product catalogue we'd like to introduce our top-selling assays to you!

## Veterinary Diagnostics

Please ask for our brochure  
"Veterinary Diagnostics".

This product group contains a wide range of immunoassays for the determination of various parameters for veterinary diagnostics and research. Our portfolio includes immunoassays for analytes of different animals like rat, mouse, dog, cat, cattle, horse and some others. Here we offer many species-specific test kits of which some are unique worldwide. These are often used by CROs and in pharmaceutical studies.

Moreover for determination of steroids in animals also our human test-kits can be used since the structure of steroid hormones is the same in all species. It would be recommended performing an extraction step of the samples prior to the assay in order to avoid any influences caused by the different matrix. To avoid this additional step alternatively steroid measurement of the free steroid fraction is possible by using salivary samples. Usually it is not difficult to get saliva samples from various animals which can be used directly in our saliva assays which can be found on the next page.

## Salivary Diagnostics

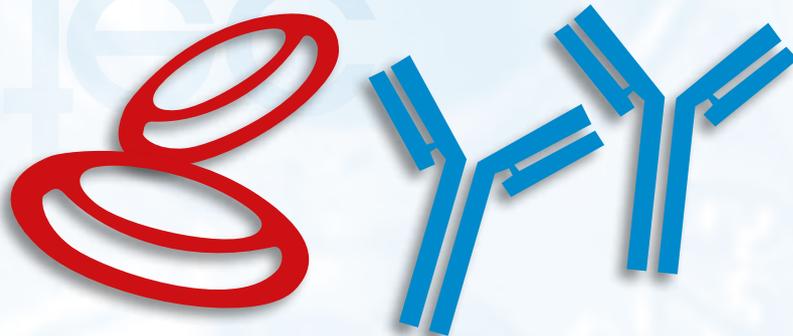

The exact measurement of hormone concentrations is important for the correct estimation of the hormone balance and endocrine function. This measurement traditionally is performed in blood/serum/plasma samples. Several hormones also can be analyzed in saliva. This technique offers several advantages: the sampling is non-invasive and can be done any-time, anywhere. Saliva testing for steroid hormones by far is the most reliable and convenient method for measuring the hormone activity in endocrine disorders and in checking the hormonal balance. Typical fields of applications are: Psychology, Endocrinology, Anti-Aging, Sports Medicine, Veterinary Diagnostics and more.

For more details please ask for our special brochure "Salivary Diagnostics".

## Autoimmunity

One of the cardinal properties of the immune system is its ability to recognize and respond to for-

eign antigens but not to self-antigens. Loss of this self-tolerance, results in immune reactions against one's, or autologous, antigens. Such reactions are called autoimmunity, and the diseases they cause are called autoimmune diseases. These ELISAs are suitable for the diagnosis and therapy monitoring of rheumatic diseases, thrombosis, vasculitis, diabetes and autoimmune diseases of the gastrointestinal tract.

# Immunology

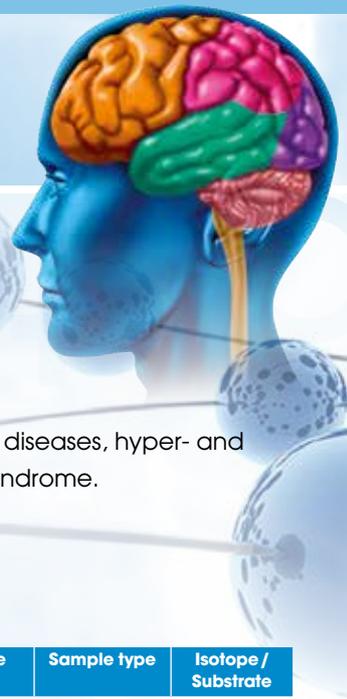

Immunology is a branch of biomedical science that covers the study of all aspects of the immune system in all organisms. It deals with the physiological functioning of the immune system in states of both health and diseases, malfunctions of the immune system in immunological disorders.

Topseller of this product group in combination with other inflammatory and fertility markers: PMN-Elastase ELISA – please obtain more details from our belonging brochure „one assay – many possibilities“.

## Biogenic Amines

Naturally occurring biogenic amines in plants, animals and humans play a crucial role as tissue hormones or neurotransmitters. There are five established biogenic amine neurotransmitters: the three catecholamines - dopamine, norepinephrine (noradrenaline), and epinephrine (adrenaline) - and histamine and serotonin. Neurotransmitters are prominent participants in the etiology of many peripheral and central nervous system disorders.

Our portfolio of Biogenic Amines is applicable for the diagnosis of e.g. Pheochromocytoma, burn-out syndrome, cardiac diseases, hyper- and hypotension and carcinoid syndrome.

## New

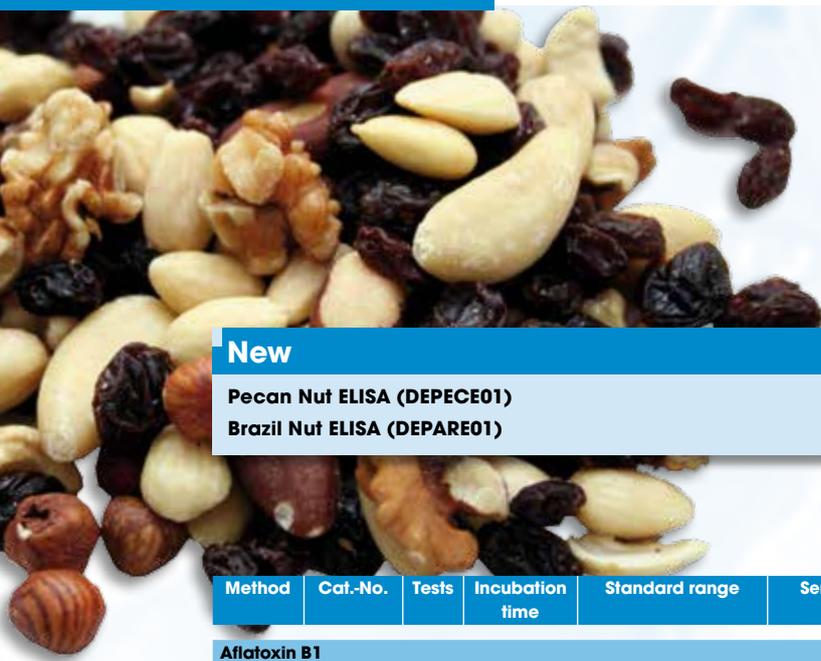

**Bordetella pertussis FHA IgG ELISA (DEBPT07)**  
**Bordetella pertussis FHA IgA ELISA (DEBPT08)**  
**Zika Virus IgM  $\mu$ -capture ELISA (DEZVM0790)**

For the detection of human IgA, IgG and IgM antibodies against bacterial, viral, fungal and protozoal antigens, we offer a wide range of infectious disease ELISAs. Their results can identify an active disease, an immunestatus or even re-infections.

**Pecan Nut ELISA (DEPECE01)**  
**Brazil Nut ELISA (DEPARE01)**

Our Food Safety/Analytics test kits allow a high-sensitive detection of residues, constituents and microbiological contaminants in food and feed. They enable a reliable and economical detection of numerous analytes like: Mycotoxins, Allergens, Antibiotics, Vitamins and Histamine. So they are part of regular and routine food controls.

Besides multiple ELISA kits we offer immunoaffinity columns (IAC) which are used for the purification and concentration of samples as preparation for subsequent analytical tests (e.g. HPLC, ELISA).

## Allergy & Food Intolerance

The Demeditec Food Intolerance Screening Tests are quantitative enzyme immunoassays (ELISA) based on the established microtiter technology. They offer a fast, sensitive and reliable detection of IgG4 antibodies to numerous food antigens in order to identify potential food intolerances. Each kit includes all reagents required for the performance of the tests. In addition to our standard formats we offer a unique concept. It allows the user to define an individual test profile by selecting food antigen layout, types and number from more than 400 available food antigens.

## Reproduction / Down-Syndrome

You can find a wide range of immunoassays for the determination of androgenic and gynaecological hormone levels in serum, plasma or in urine samples in the following table. Hormones are substances produced in particular organs (glands) and transported to their site of action by the blood stream. In combination with the nervous system, hormones control metabolic processes in the entire body.

The steroid hormones are a special group of hormones that play an important role in many essential physiological processes, such as sex differentiation, fertility, pregnancy, mineral metabolism, energy metabolism and others.

As many disorders and diseases are caused or accompanied by too high or too low hormone levels, their determination is an important tool in the clinical laboratories.

## Bone Metabolism

Bone has well recognized mechanical functions: it provides rigidity and shape, protection and support for body structures, and aids locomotion. Contrary to popular belief, bone is in fact a highly dynamic structure undergoing constant remodelling. It is continuously characterized by resorption and adsorption

as a part of bone metabolism. Bone metabolism includes the activity of several hormones, e.g. Osteocalcin, Parathyroid hormone (PTH) and Vitamin D. Therefore determination of these analytes is valuable for monitoring bone metabolism in a professional way.

## Thyroid

This chapter contains various products for the laboratory investigation of thyroid diseases. These products are available in ELISA and RIA technology and include products for the quantitative measurement of free and total thyroid hormones and high sensitive TSH assays. Also we are offering test kits for the measurement of antibodies directed against TSH receptors of the thyroid gland.

## Nephrology

Nephrology concerns the diagnosis and treatment of kidney diseases, including electrolyte disturbances and hypertension, and the care of those requiring renal replacement therapy, including dialysis and renal transplant patients. Many diseases affecting the

kidney are systemic disorders not limited to the organ itself, and may require special treatment.

A tumor marker is a substance found in the blood, urine, or body tissues that can be elevated in cancer, among other tissue types. There are many different tumor markers, each indicative of a particular disease process, and they are used in oncology to help detect the presence of cancer. An elevated level of a tumor marker can indicate cancer; however, there can also be other causes of the elevati-

on. Tumor markers can be produced directly by the tumor or by non-tumor cells as a response to the presence of a tumor. Determination of tumor marker levels by serum testing are useful for: diagnosis of cancer, prognosis cancerous tumors progression, indicating of metastases, detection of residual disease (after surgery), assessment of cancers treatment.

## Growth Factor

Growth factors are soluble-secreted signaling polypeptides capable of instructing specific cellular responses in a biological environment. The specific cellular response triggered by growth factor signaling can result in a very wide range of cell actions, including cell survival, and control over migration, differentiation or proliferation of a specific subset of cells. They also play important roles in the maintenance of tissue homeostasis and

wound healing in the adult. Their activities are mediated via binding to transmembrane receptors that often contain cytoplasmic tyrosine kinase domains. When unregulated, many growth factors and their receptors have been implicated in tumor formation. In summary the system of Growth Hormone and the Insulin-like Growth Factors with their Binding Proteins is an important control cycle.
