...diagnostics

www.demeditec.com

Demeditec Diagnostics GmbH is a private company located in northern Germany. Since the foundation in 1987 Demeditec has rapidly grown to become a successful and reliable manufacturer and supplier of in-vitro diagnostic test kits. Currently we are happy to present an extensive product panel of non-radioactive (ELISA, PCR and lateral flow rapid tests) and radioactive (RIA) test-systems.

Our top-selling products are covering the fields of Veterinary Diagnostics, Endocrinology (in particular Salivary Diagnostics), Infectious Disease, Autoimmunity, Allergy and Tumor Markers.

Demeditec is giving special attention to the upcoming innovations in diagnostic area. In this field we are offering testkits for

detecting salivary hormones and Food Intolerances.

Our customers are located worldwide. These mainly are private laboratories, hospitals, universities as well as other research institutions and pharmaceutical companies.

To ensure the quality of our products, services and support, Demeditec has been certified for EN ISO 9001 and EN ISO 13485 since 2003. This especially brings benefits during developments of innovative test kits in our R&D department.

■ Introduction

Dear partner,

by specializing and expanding our veterinary product range, we are able to supply new kinds of customer groups and establish our enzyme-immunoassays in numerous veterinary laboratories and pharmaceutical companies.

With this product brochure we'd like to introduce our top-selling veterinary assays to you!

Testosterone rat /mouse ELISA

Cat.-No.: DEV9911

The DEMEDITEC Testosterone rat/mouse ELISA is a competitive immunoassay for the quantitative measurement of testosterone in rat and mouse serum or plasma.

regulation of spermatogenesis by testosterone.

In the Brown Norway rat, serum testosterone levels decrease with aging, accompanied by increases in serum FSH. The capacity of Leydig cells to produce testosterone is higher in young than in old rats. Testosterone secreted during late gestational and neonatal periods causes significant brain sexual dimorphism in the rat. This results in both sex-specific behaviour and endocrinology in adults.

Analyses concerning the regulation of synthesis reveal that testosterone is able to regulate its own synthesis and indicate that this autoregulation is the result of rapid, specific inhibition by testosterone of 17 alpha-hydroxylase activity.

Technology	ELISA
Kit size	96
Sample material	rat/mouse serum or plasma
Sample preparation	-
Sample volume	10 µl
Standard range	0.1 - 25 ng/ml
Incubation	60 min (shaking), 30 min
Measuring system	TMB 450 nm
Sensitivity	0.066 ng/ml

Testosterone is a steroid hormone from the androgen group synthesized by the Leydig cells in the testes in males, the ovaries in females, and adrenal glands in both sexes. It exerts a wideranging influence over sexual behaviour, muscle mass and strength, energy, cardiovascular health and bone integrity.

Testosterone biosynthesis coincides with the spermatogenesis and fetal Leydig cell differentiation in the male rat. Several in vivo models including hormone-suppression, hormone-restoration and hypophysectomy were established for the study of the hormonal

PLEASE NOTE:

According to the respective ELISA a **Rat control-kit (Cat. No. DEV99RC)** is available and can be used for internal quality control.

Corticosterone rat/mouse ELISA

Cat.-No.: DEV9922

The DEMEDITEC Corticosterone rat/mouse ELISA is a competitive immunoassay for the quantitative measurement of corticosterone in rat or mouse serum and plasma.

being observed between 1600 and 2200 hours in a normal laboratory environment.

Corticosterone measurements are a useful index of general and neuroendocrine response to the stress of laboratory experiments in mice and rats. Thus corticosterone concentrations rise sharply in healthy, intact animals following exposure to experimental stimuli such as drugs, barometric shock, experimental disease state, or abrupt temperature shifts, and may serve to document the neuroendocrine and endocrine integrity of the preparation while observations are being made.

Technology	ELISA
Kit size	96
Sample material	rat/mouse serum or plasma
Sample preparation	-
Sample volume	10 µl
Standard range	15 – 2250 ng/ml
Incubation	2 h, 30 min at RT
Measuring system	TMB 450 nm
Sensitivity	4.1 ng/ml

Corticosterone is the principle glucocorticoid secreted by the adrenal cortices of mice and rats. Secretion of corticosterone in these species is modulated by a complex negative feedback mechanism involving the central nervous system, hypothalamus, pituitary, and adrenals.

ACTH released from the pituitary augments adrenal secretion of corticosterone while falling levels of corticosterone are associated with rising levels of ACTH. In both mice and rats there is a circadian rhythm of corticosterone release with the highest concentrations

PLEASE NOTE:

According to the respective ELISA a **Rat control-kit (Cat. No. DEV99RC)** is available and can be used for internal quality control.

Prolactin rat ELISA

Cat.-No.: DEV9966

The DEMEDITEC Prolactin rat ELISA is an enzyme-immunoassay for the quantitative measurement of rat prolactin in serum.

hormone (TRH) and vasoactive intestinal peptide (VIP). There is also evidence that rat posterior pituitary lobe contains a special prolactin releasing hormone.

The most important role of prolactin is stimulation of mammary gland growth and lactation. During pregnancy, blood prolactin levels climb, but the increases can differ enormously between rats. High prolactin levels are observed during lactation. Prolactin has a wide variety of other physiological actions, for example on the ovary. In the rat, prolactin has a luteotropic effect which is not seen in many other species. Furthermore, prolactin is a stress hormone.

In rats, as in humans, prolactin exhibits a sleep-related diurnal variation. Peak values are seen in the late afternoon and nadir values in the morning.

Because of the variety of its actions, prolactin is one of the preferred hormones to monitor when testing the influence of new therapeutic agents and drugs on the endocrine system in the rat.

PLEASE NOTE:

According to the respective ELISA a **Rat control-kit (Cat.-No. DEV99RC)** is available and can be used for internal quality control.

Technology	ELISA
Kit size	96
Sample material	rat serum
Sample preparation	-
Sample volume	25 µl
Standard range	5 - 80 ng/ml
Incubation	2 h (shaking), 1 h (shaking), 30 min at RT
Measuring system	TMB 450 nm
Sensitivity	0.6 ng/ml

Rat prolactin (rPRL) is a single-chain polypeptide hormone of the rat anterior pituitary with a molecule mass of approximately 23,000. Prolactin from different species exhibits significant variations in the amino acid sequence. Rat prolactin differs from human prolactin at about 50 percent of all residues.

The secretion of rPRL from the pituitary is inhibited by hypothalamic prolactin-inhibitory factor (PIF). Although dopamine was long thought to be this PIF molecule, today it seems that there is a special peptide with prolactin-inhibiting activities.

The release of prolactin is certainly stimulated by different peptides, particularly thyrotropin releasing

TSH rat ELISA

Cat.-No.: DEV9977

The DEMEDITEC TSH rat ELISA is an enzyme-immunoassay for the quantitative measurement of rat TSH in serum.

Technology	ELISA
Kit size	96
Sample material	rat serum
Sample preparation	-
Sample volume	25 μ l
Standard range	2.5 – 80 ng/ml
Incubation	overnight (4°C) – 30 min at RT
Measuring system	TMB 450 nm
Sensitivity	0.1 ng/ml

Thyroid stimulating hormone (also known as thyrotropin or TSH) is a glycoprotein produced by the anterior pituitary gland. Through its action on the thyroid gland, it plays a major role in maintaining normal circulating levels of the iodothyronines, T4 and T3. The production and secretion of TSH is controlled on the one side by negative feedback from circulating T4 and T3, and on the other side by the hypothalamic thyrotropin-releasing hormone (TRH).

The TSH molecule is composed of two non-identical subunits, α and β , that are bound together in a noncovalent manner. Within a species, the TSH α unit is structu-

rally identical to the α subunits of related glycoprotein hormones (LH, FSH). The β subunits of the related hormones are structurally hormone-specific and therefore determine their unique biological activities.

The mechanism controlling thyroid function in rats is exactly analogous to the mechanism operating in humans. This means that thyrotropin-releasing hormone stimulates the release of TSH from the pituitary gland as well as the serum concentrations of T4 and T3 influence the action of the pituitary gland.

This similarity between rat and human thyroid physiology makes the rat a very useful model for evaluating the effects of new drugs on thyrometabolic status.

PLEASE NOTE:

According to the respective ELISA a **Rat control-kit (Cat. No. DEV99RC)** is available and can be used for internal quality control.

Prolactin canine ELISA

Cat.-No.: DEV9944

The DEMEDITEC Prolactin canine ELISA is an enzyme immunoassay for the quantitative measurement of canine prolactin in serum.

Technology	ELISA
Kit size	96
Sample material	canine serum
Sample preparation	-
Sample volume	25 µl
Standard range	2.5 - 80 ng/ml
Incubation	2 h (shaking), 1 h (shaking), 30 min at RT
Measuring system	TMB 450 nm
Sensitivity	0.4 ng/ml

Canine prolactin (cPRL) is a single-chain polypeptide hormone of the canine anterior pituitary with a molecular mass of approx. 22,000. Prolactin from different species exhibits significant variations in the amino acid sequence. Canine prolactin differs from human prolactin at about 60 percent of all residues.

The secretion of cPRL from the pituitary is inhibited by hypothalamic prolactin-inhibitory factor (PIF). Although dopamine was long thought to be this PIF molecule, today it seems that there is a special peptide with prolactin-inhibiting activities. The release of prolactin is certainly stimulated by different peptides, particularly thyrotropin releasing hormone (TRH) and vasoactive intestinal peptide (VIP). Estrogens and progesterone also seem to play a role in the secreti-

on of prolactin, and neurogenic factors influence its release. Milking and suckling are immediately followed by an increase in serum cPRL.

The most important role of prolactin is stimulation of mammary gland growth and lactation. During pregnancy, prolactin levels in canine blood increase slightly; during lactation, significantly. Prolactin has a wide variety of other physiological actions. It affects water and electrolyte balance, metabolism and gonadal function; is an important stress hormone; and seems to play a role in the maintenance of the long interestrous interval in the bitch.

In dogs with pituitary-dependent hyperadrenocorticism, prolactin levels in blood were higher than in healthy animals. Prolactin determinations can be used in the therapeutic control of hyperprolactinemia. During a pseudo pregnancy, prolactin is increased. Therapy with alkaloids like bromocriptine lowers PRL levels, and lactation and maternal behaviour are decreased.

The secretory capacity of the pituitary can be tested with the TRH stimulation test.

PLEASE NOTE:

According to the respective ELISA a **Prolactin canine Control (Cat.-No. DEV9944C)** is available and can be used for internal quality control.

TSH canine ELISA

Cat.-No.: DEV9955

The DEMEDITEC TSH canine ELISA is an enzyme immunoassay for the quantitative measurement of canine TSH (thyrotropin) in serum or plasma.

Technology	ELISA
Kit size	96
Sample material	canine serum or plasma
Sample preparation	-
Sample volume	100 μ l
Standard range	0.2 - 5.2 ng/ml
Incubation	2 h (skaking), 30 min at RT
Measuring system	TMB 450 nm
Sensitivity	0.01 ng/ml

Thyroid stimulating hormone (TSH, thyrotropin) in dogs is similar in function to TSH found in other mammalian species, including humans. It is a glycoprotein produced by the anterior pituitary gland. Through its action on the thyroid gland, it plays a major role in maintaining normal circulating levels of the iodothyronines, T4 and T3. The production and secretion of TSH is controlled by negative feedback from circulating T4 and T3, and by the hypothalamic hormone TRH (thyrotropin releasing hormone). The TSH molecule is composed of two non-identical subunits, a and b, that are bound together in a noncovalent manner. Within a species, the TSH a subunit is structurally identical to the a subunits of the related glycoprotein hormones (LH, FSH and chorionic gonadotropin). The b

subunit of TSH and the b subunits of the related hormones are structurally hormone-specific, and confer upon them their unique biological activities.

Hypothyroidism is considered to be a common endocrine disorder in dogs, whereas hyperthyroidism in this species is nearly unknown. Most cases of canine hypothyroidism are primary in nature, involving impaired production of the thyroid hormones, T4 and T3. In this condition, elevated TSH levels are expected. Secondary or tertiary hypothyroidism, where thyroid hormone production is low as a consequence of hypothalamic or pituitary disease, is believed to account for less than 5% of canine hypothyroidism cases. In the latter conditions, lowered levels of TSH would be expected. Usually, hypothyroidism in dogs is suspected on the basis of clinical history and the presence of lowered levels of thyroid hormones. However, suppressed thyroid hormone levels are nonspecific indicators of the disease, since they are often observed in non-thyroid illnesses. The evaluation of thyroid function and the diagnosis of hypothyroidism in dogs can be greatly improved through the use of the valid assay for the determination of canine TSH.

Estrone-3-Sulfate equine ELISA

Cat.-No.: DEV9933

The DEMEDITEC Estrone-3-Sulfate equine ELISA is a competitive enzyme immunoassay for the quantitative measurement of estrone-3-sulfate in mare serum.

pidly conjugated after secretion and the ratio between conjugated and unconjugated estrogens is 100:1 in mare serum.

The conjugated estrogens, especially Estrone-3-sulfate, provide the opportunity to improve the accuracy of pregnancy diagnosis, to monitor the pregnancy and to distinguish whether the fetal development is normal or impaired. The diagnosis of embryonic death is usually made by using techniques of palpation of the uterus per rectum or ultrasound echography. The determination of Estrone-3-sulfate is an aid in the non-invasive diagnosis which allows a monitoring of the feto-placental unit during pregnancy. Only in mares with normal fetal development the values of Estrone-3-sulfate show a tremendous increase between day 75 and 100 of gestation.

Technology	ELISA
Kit size	96
Sample material	mare serum
Sample preparation	-
Sample volume	20 µl
Standard range	5 - 1000 ng/ml
Incubation	1 h (shaking), 30 min (shaking), 30 min at RT
Measuring system	TMB 450 nm
Sensitivity	0.14 ng/ml

Estrone-3-Sulfate (E3S) is the predominant conjugated estrogen during pregnancy. It is produced by the fetus, possibly in association with the endometrium in the pregnant mare.

Different hormones are important for the complex events that occur during pregnancy in all mammals. In the mare these events include the maintenance of the corpus luteum function, formation of endometrial cups and development of secondary corpora lutea. Progesterone and PMSG (Pregnant Mare Serum Gonadotropine, eCG) and also free Estrogens, e.g. Estrone, are associated with these processes. It has been shown, that Estrone is ra-

PLEASE NOTE:

According to the respective ELISA an **Estrone-3-Sulfate equine Control (Cat.-No. DEV9933C)** is available and can be used for internal quality control.

Estrone-3-Sulfate equine Control

Cat.-No. DEV9933C

Suitable for internal control quality of the following ELISA:
DEV9933 Estrone-3-Sulfate equine

Components	Content
Canine Prolactin Control 1/2: Two levels of prolactin in canine serum	1 Set 2 vials à 1 ml

Prolactin canine Control

Cat.-No. DEV9944C

Suitable for internal control quality of the following ELISA:
DEV9944 Prolactin canine

Components	Content
Canine Prolactin Control 1/2: Two levels of prolactin in canine serum	1 Set 2 vials à 1 ml

Rat control-kit

Cat. No. DEV99RC

Rat control sera suitable for internal control quality of the following ELISAs:

DEV9911 Testosterone rat / mouse
DEV9922 Corticosterone rat / mouse
DEV9966 Prolactin rat
DEV9977 TSH rat

Components	Content
Rat Control 1/2: Two levels of Testosterone, Prolactin, Corticosterone and TSH in rat serum	1 Set 2 vials à 1 ml
